   4.1. Research question on the aspect of Learning culturally competent compassion in theory and practice
   4.2. Specific search terms on the aspect of Learning culturally competent compassion in theory and practice
   4.3. Search history on the aspect of Learning culturally competent compassion in theory and practice
   4.4. List of References on the aspect of Learning culturally competent compassion in theory and practice
   4.5. Extraction sheet on the aspect of Learning culturally competent compassion in theory and practice

5 Conclusion
1. Integrative reviews around three aspects of compassion

1.1 Background

The reviews presented in this report encompass the first output (O1) of the IENE4 project. The deliverables of O1 (reviews) were:
1. Literature inclusion criteria
2. List of key search terms
3. List of relevant publications/full reference
4. Final list of publications to be reviewed
5. A set of extraction sheets populated with data
6. Write up the findings

The reviews are based on the overall research question: “How do nurses and other health professionals learn to practice culturally competent compassionate care?” (Project Application form, p. 40). The aim of the reviews was to provide a comprehensive picture of the published research and scholarly opinion on the topics: Universal components of compassion; Measuring culturally competent compassion; Learning culturally competent compassion in theory and practice (Project Application form, p. 40).

An integrative approach was applied in the reviews as this allows for inclusion of diverse methodologies and varied perspectives on the phenomena of concern. Hence, integrative reviews have wide ranging abilities: To define concepts, to review theories, to review evidence, to analyze methodological issues of a particular topic, etc. (Whittemore and Knafl, 2005).

The process of each review encompassed: a) formulation of a specific research question; b) identification of search terms; c) literature searches; d) data evaluation; d) data analysis; e) presentation in extraction sheet.

1.2 General literature inclusion criteria

Written in English
Written in the last 30 years
Peer-reviewed
Dealing with compassion and the healthcare professions (primarily nurses or other health professionals) not compassion in general.
1.3 General list of key search terms

Universal components of compassion
Model of compassion
Culturally competent compassion
Compassion in theory and practice
Cultural competence; culture and compassion
Compassion and theory; compassion in practice

Additional search terms are specified in each individual review section below.

1.4 Data evaluation and data analysis

All literature was assessed against the inclusion criteria, and the CASP (Critical Appraisal Skills Programme) checklist was applied for cohort studies as a quality assessment tool. However, quality appraisal guidelines were not available for all the varying types of literature. Consequently, literature that met the inclusion criteria was generally included. Within each review, all included literature was compiled in an extraction sheet presented in each respective section below.

References:
2. Review on Universal components of compassion

2.1. Research question on the aspect of Universal components of compassion

Which components of compassion in healthcare (primarily nursing but not excluding care given by other health professionals) are universal?

2.2. Specific search terms on the aspect of Universal components of compassion

Compassion
Nursing
Health professionals
Culture
Universal components of compassion
Concept analysis and compassion
Compassionate care and concept
Components of compassion and nursing
Dimensions of compassion and nursing
Elements of compassion and nursing
Culture and compassionate care
Value and compassionate care
Multicultural compassion
2.3. Search history on the aspect of Universal components of compassion

3858 papers found from initial searches

1279 duplicates excluded

2579 abstracts screened

2540 unsuitable papers excluded

39 papers full text screened

14 unsuitable papers excluded

25 papers included in final analysis

2.4. List of References on the aspect of Universal components of compassion

## 2.5. Extraction sheet on the aspect of Universal components of compassion

| Van der Cingel, M | 2009 | The Netherlands |                    | To explore questions and contradictions in the debate on compassion related to nursing care | The paper reviews classical philosophers as well as contemporary scientists’ main arguments on compassion in order to explore the nature of compassion. | - In Aristotelian and justice theories, Christian-philosophical and Buddhist traditions, as well as Ethics of care theories, suffering (physical, psychological and social) is considered to be the trigger for compassion.  
- Compassion is also described as pain, sorrow or grief for someone else.  
- When a loss is permanent, compassion is a relevant response.  
- The aspect of “feeling with” the other person comprehends the affective component of compassion.  
- To feel compassion means to “read” the other person without imposing one’s own interpretation/perspective.  
Imagination and reflection are the means to this (the affective aspect of compassion). In order to know the significance of the loss as the other person sees it.  
- Personal attachment helps in identifying precisely when... |
| Schantz, ML | 2007 | USA | To clarify the | A concept analysis | -The concept of “compassion” is unconditioned and unselfish. | In Rodgers’s | compassion is needed. On the other hand maintaining a certain professional “distance” can help patients to show emotions. -Too much compassion can end up in self-sacrifice, and too little in neglect. -Compassion is an emotion, i.e. in order to feel compassion one has to have a specific thought (of suffering) (the cognitive aspect of compassion). -The object of compassion is the other person in his or her awkward situation. -Compassion includes wanting the best for the one suffering (unselfishness, altruistic emotion). -Compassion needs to be unconditionally available, judgement free, towards everyone who suffers. -Compassion helps another person by answering emotions such as anger, anxiety, sorrow and grief that come into being as a consequence of suffering. Suffering does not disappear because of compassion. But is offers comfort because it shows that a loss is terrible, that suffering is visible and one is not left alone. |
| Meaning of the concept “compassion” and examine its relevance in the context of everyday nursing practice | Using Walker and Avant’s strategic method as well as Rogers’s evolutionary paradigm. Literature was generated from an electronic search. Key terms were “concept analysis”, and “compassion”. To define the word compassion. Various English dictionaries were consulted; textbooks on nursing theories, academic journal articles, and online resources were reviewed. And as compassion conveys close relevance to the fields of religion and ethics, literature from these disciplines was used as well. | Neither clearly defined in nursing scholarship nor widely promoted in everyday nursing practice. -Nursing research that uses terms such as caring, empathy, sympathy, compassionate care and compassion interchangeably, implying that these words are synonymous, promotes erroneous assumptions. -In current nursing scholarship and everyday nursing practice words such as “caring” and “empathy” have gained popularity. And compassion is often replaced by caring. -Yet, it was compassion that early nurse leaders identified as a characteristic of a “good nurse”. It was considered an inherent quality a nurse should have, and represented “an internalized motivation for doing good. It transcendent mere sentiments. It entailed “making justice and doing works of mercy”. -The definition of the word compassion is consistent in most of the dictionaries consulted. From Latin *com* (together with) and *pati* (to suffer). Oxford English Dictionary: *Suffering together* | Evolutionary view, “concepts are contextually located and understood to change over time” |
IENE4 Output 1: Three integrative reviews

with another, participation in suffering; fellow-feeling, empathy. The feeling of emotion, when a person is moved by the suffering or distress of another, and by the desire to relieve it; pity that inclines one to spare or to succour. Most dictionaries state the word compassion to encompass a deeper sympathy for the sorrow or trouble of one’s fellow man compared to similar words e.g. empathy, sympathy and pity.

- What distinguishes compassion from most related words is its intrinsic motion gathered effect, i.e. only compassion impels and empowers people to not only acknowledge, but also act toward alleviating or removing another’s suffering or pain.

- Compassion is not an inherent quality human beings possess.

- But as compassion is perceived as a necessary result of being human, human beings feel insulted when they are accused of lacking compassion because it implies that they are “non-human beings”.

- Philosophers have asked whether nurses ought to be expected to take their role to so

19th century Great Britain when Florence Nightingale paved the way for the profession. The ethos of compassion in nursing from a contemporary perspective will then be discussed before considering the current problems as identified through variety of negative patient experiences.

- Nightingale also discussed the concept of suffering in the sick, highlighting that nurses must strive to alleviate this through acts of compassion.
- However, as nursing became more evidence based, the traditional vocational image seemed to decline in favour of technical skills and the ethos of compassion as an essential professional nursing virtue appeared to have eroded.

Part 2: Discusses current political and professional drivers for compassion in contemporary nursing and definitions of compassion and its implications for contemporary nursing practice.

- In 2010 the Department of Health, London, published the NHS Constitution, which aims to establish the principles and values underpinning the health service and identify the rights of patients, public and staff with a series of pledges. One of these related specifically to compassion: “Compassion...we respond with humanity and kindness to each person’s pain, distress, anxiety or need. We search for the things we can do, however small, to give comfort and relieve suffering. We find time for those we serve and work alongside. We do not wait to be asked, because we care” A

Discuss that appropriate recruitment and selection strategies need to be implemented to obtain the most suitable student nurses. And that nurses need to be supported to enable compassionate care. Leadership for compassion is essential.
- Department of health further states: “Truly compassionate care is skilled, competent, value based care that respects individual dignity”.
- Despite the current political and professional pledges to ensure that compassion lies at the heart of nursing, defining and understanding its true meaning is complex, owing to its subjective nature.
- Refers many times to Schantz (2007), yet a further definition of compassion is: the humane quality of understanding suffering in others and wanting to do something about it.”
- Indeed, compassion means that nurses need to see beyond the patient by recognizing his or her humanity and individuality.
- Original research on the concept of compassion is scarce and, until further work is undertaken, the definitive meaning is elusive.

<p>| Davison, N and Williams, K | 2009 | UK | Describe the contribution that compassion makes to clinical practice. | An outline of what compassion is and how it might be measured, as this essential nursing quality moves | One of the difficulties in considering issues such as compassion is that everyone – patients, nurses and politicians – will have their own personal, |</p>

All nurses regardless of their location in the world, reported compassionate caring. Compassion requires nurses to go beyond hands-on-skills and techniques and focus on alleviating suffering and pain through empathic concern. Compassion requires that nurses be present emotionally and physically. Compassion was a universal finding in this study. Many of the stories that focused on compassion were experienced by nurses who work with women and children. These moments made the nurse appreciate the compassion it takes to be excellent in the nursing profession.
| Badger, K and Royse, D | 2012 | USA | Burn survivors, primarily Caucasian (77%), female (60%) with average age of 47.6 y. | Investigate the concept of compassionate care and how it is described from the perspective of the burn survivor. A qualitative design with two focus groups at the Phoenix Society for Burn Survivors’ World Burn Congress was used to examine views of compassionate care directly through n=31 burn survivors’ accounts. Qualitative data analysis yielded primary themes of: 1) Respect the person (subthemes: establishing an empathic connection, restoring control through choice, providing individualized care, and going above and beyond), 2) Communication (subthemes: interpersonal and informational (educational and preparatory)), and 3) provision of competent care. The three primary themes were components of compassionate care; it was not defined by a single characteristic, behavior, or skill but might be best understood as the convergence of the three themes. |
| Gelhaus, P | 2012 | Sweden | In this article, the emotional and virtuous core of the desired professional attitude—compassion—is elaborated. In a sequel of three articles, “empathy”, “compassion”, and “care” is presented as a set of concepts suggested to describe the desired implied attitude of physicians. Compassion is distinguished from sympathy, empathy and pity. An interpretation of compassion as processed and learned professional attitude, that founds dignity on the general idea of man as a sentient being, and on solidarity, not on his independence and capacities, is. In the first article, “empathy” was developed as a mainly cognitive and morally neutral capacity of understanding of what happens inside the patient in.
developed. In order to reach the adequate warmth and closeness for the particular physician-patient-relation, professional compassion has to be combined with the capacity of empathy - “empathic compassion”. Compassion as an immediate still non-processed affect could be understood as a certain emotional response to the experienced suffering of another person. Characteristic for a compassionate reaction is 1) recognition of suffering, 2) benevolence, 3) a feeling of being personally addressed (I feel responsible to react, at least emotionally. An emotionally relationship to another person arises), and 4) an inclination to relieve the suffering (unlike sympathy, compassion is no affection that aims at symmetry: the assumption of asymmetry of both persons involved is an essential element of this concept. I do not expect of somebody for whom I feel compassion to answer with the same feeling or to respond at all) Compassion is not yet a direct impulse to help actively. I could respond to the other’s relation to his complaints. The concept of “care” is a missing necessary part to describe the active potential of the desired moral attitude of the physician more completely.
Three integrative reviews

| Pembroke, N | 2010 | Australia | To cast new light on the human dimension in medical care. | Martin Buber’s concept of inclusion and Gabriel Marcel’s notion of availability are applied to discuss human dimension in medical care. | Inclusion and availability are two helpful concepts in the task of reflecting on compassionate medical care. Inclusion suggests that genuinely empathic attunement to the suffering of people, can very well serve as a general moral value and guideline that can and ought to be demanded as the right attitude, directed to the central goals of medicine. If the spontaneous, warm feeling of compassion is not demanded in every case, it does not seem to overstrain the capacities of average persons to internalize this attitude. Even extremely unsympathetic, disgusting or vicious patients can be treated with compassion in this sense, as it does not necessarily imply a warm emotional closeness and personal sympathy.

BUT: Compassion as a general attitude of a healthcare professional to feel the inclination to help suffering people, can very well serve as a general moral value and guideline that can and ought to be demanded as the right attitude, directed to the central goals of medicine. If the spontaneous, warm feeling of compassion is not demanded in every case, it does not seem to overstrain the capacities of average persons to internalize this attitude. Even extremely unsympathetic, disgusting or vicious patients can be treated with compassion in this sense, as it does not necessarily imply a warm emotional closeness and personal sympathy.

To cast new light on the human dimension in medical care.

Pembroke, N 2010 Australia

To cast new light on the human dimension in medical care.

Martin Buber’s concept of inclusion and Gabriel Marcel’s notion of availability are applied to discuss human dimension in medical care.

Inclusion and availability are two helpful concepts in the task of reflecting on compassionate medical care. Inclusion suggests that genuinely empathic attunement to the suffering of people, can very well serve as a general moral value and guideline that can and ought to be demanded as the right attitude, directed to the central goals of medicine. If the spontaneous, warm feeling of compassion is not demanded in every case, it does not seem to overstrain the capacities of average persons to internalize this attitude. Even extremely unsympathetic, disgusting or vicious patients can be treated with compassion in this sense, as it does not necessarily imply a warm emotional closeness and personal sympathy.
### Bramley, L and Matiti, M 2014 UK

A purposive sample of n=10 patients in a large teaching hospital in the UK. Female 50%. Age 18-91 y.

To understand how patients experience compassion within nursing care and explore their perceptions of developing compassionate nurses

A qualitative exploratory descriptive approach. In-depth, semi-structured interviews were conducted with

The connection between compassion and caring was so strong that many participants did not delineate between the two, often substituting "compassion" for "care" and "caring" throughout the interviews. Compassion was described in this study as nurses caring for patients as individual human beings and the presence of their touch within one to one interactions. It was seen as providing encouragement in medical care. The patient requires both cognitive and affective engagement. If the clinician connects on the mental level only, the patient is likely to feel understood but not cared for. Availability requires a certain incohesion or permeability in the clinician. She is ready to open herself fully to the experience of her patient and enter into this. That is she needs to imagine what it is to be this person – to be someone who is experiencing pain and discomfort, disorientation, fear, and uncertainty. In the absence of any attempt to reach across the inter-personal space, there is simply no possibility of growing into compassion.

von Dietze, E and Orb, A 2000 Australia Focusses on the concept of compassion and Discussion paper It is difficult to identify what exactly comprises compassionate care.
Compassion is not only simply a natural response to suffering, but more of a moral choice. It is a moral virtue that gives context and direction to nurses’ decisions and actions. Authors argue that compassion is not merely an emotional connection that nurses establish with their patients, they see compassion as a moral virtue, which gives context and direction to nurse’s decisions and actions which exhibits excellence in nursing practice. Compassion involves a moral dimension (our relating to needs of others and our reaching beyond our immediate self-interest) and thus requires understanding and deliberate decisions. Compassion in other words, is based on rational thought and evaluation, not on sentiment alone. Empathy implies being touched by and understanding the reality of another person, it does not specifically require action. Only a commitment to hear and understand. Empathy and sympathy in or of themselves do not imply good therapy or care: they are simply part of the conditions required for appropriate therapeutic
intervention. Compassion involves deliberate participation in another person’s suffering, not merely identification of the suffering but identification with it. It is this particular link with action that differentiates compassion from empathy and sympathy.

While compassion may require emotion it also has a rational dimension and at its core is the notion of deliberate altruistic participation in another person’s suffering. As such compassion is more than an emotion it revolves around the ways we relate to other people and demands that we act.

Compassion is about a deep sense of solidarity with others, and compassionate care is one’s willingness to enter into the problem, confusion or questioning of another person together with that person.

Compassionate care thereby enables patients to remain independent and retain their dignity.

One of the guiding choices for compassion is altruism where there is intentional, deliberate voluntarily behavior in support of another person that is not given with the expectation of
IENE4 Output 1: Three integrative reviews

| Pacquiao, DF | 2008 | USA | Attempts to present a model linking competence with advocacy for social justice and protection of human rights in caring for vulnerable groups such as refugees and asylum | Discussion paper based on theories and models |

Compassion is identified as the key component for culturally-competent advocacy for social justice and human rights protection. Compassion compels actions for social justice and protection of human rights for marginalized and powerless people. Compassion has been identified by several authors as the motivation that compels one to any reward or punishment. What is unique about compassion is the congruence between reasoned justification and morally driven action. As a moral virtue it fulfills the essential criteria of requiring both emotional and thoughtful (reasonable) response, but often lived out in creative tension. Compassion is inextricably linked with action: listening, feeding, clothing, visiting, sheltering, educating, comforting, forgiving, to mention a few. Yet, it is not such actions in or of themselves which are compassionate, but the way in which they are carried out, the attitude and approach – in other words the way the moral virtue is applied into a situation.

Newcastle upon Tyne region, willing to share their views and take the time to complete at least the first questionnaire were eligible. Three integrative reviews described understanding of moral concepts and moral theories, and to inquire into their reasons for holding particular moral beliefs. One being the meaning and importance of compassion in psychiatric nursing. One, decreasing to n=14 in the final third round. There were three rounds of questionnaires, all semi-structured.

| Forrest, C | 2011 | UK | Short debate article | Acting in a kind and compassionate way: Express a genuine interest in your patient. Acknowledge their thoughts, feelings and what

“I...” Sixteen different meanings were suggested: Give time and listen; show understanding about how they are feeling/behaving; compassion is caring and showing it; assisting others to make their own decisions; not to deny the client any rights; to always act in the client’s best interest.

“IS behaving and acting compassionately important to the goal of being an ethical psychiatric nurse?” 71.4% responded in the affirmative to this question, e.g. I think behaving and acting compassionately is a goal of being human but particularly for nurses, caring for vulnerable people; Compassion and real caring are the same, to care without compassion isn’t real.
matters to them. From a position of rapport and empathy, extend kindness by instilling hope, although not false hope. Notice and take account of your patient’s fears and vulnerabilities. Acknowledge the other person’s viewpoint as valid, even if you don’t agree with it yourself. Express kindness in words, but make sure it is genuine and supported by congruent body language, gestures and eye contact. Look people in the eye when you enter their home or invite them into your consulting room. If you are late, apologize genuinely and try always to think of the patient’s perspective: they are likely to be anxious, possibly frustrated of having to attend, or apprehensive about the procedure or some test results. Even if you are short of time, convey a sense of having time for the patient by facing them and listening to them, giving them the opportunity to respond, reflect and react to your questions. If you offer extra support of any kind, make sure it is reasonable and that you carry out your actions: or if
| Dewar, B and Nolan, M | 2013 | UK | The study actively involved older people (n=10), staff (n=35) and relatives (n=12) in agreeing a definition of compassionate relationship-centered care and identifying strategies to promote such care in acute hospital settings for older people. The paper describes the development of a model of compassionate relationship-centered care that whilst developed in the UK has global relevance. The paper describes a study that more fully articulates the types of relational knowledge that underpins compassion from the perspective of older people, staff and relatives. | The study used appreciative inquiry and a range of methods including participant observation, interviews, storytelling and group discussions to actively engage older people, relatives and staff. | Compassion is only achieved through, often complex, relational practices. A consensus as to a definition of compassion is lacking. However, some key attributes were identified, including: recognizing vulnerability and suffering; relating to the needs of others; preserving integrity and acknowledging the person behind the illness. Compassion primarily involves an awareness of another’s feelings, an appreciation of how they are affected by their experiences and interacting with them in a meaningful way. Compassion can be considered as having 4 essential characteristics: 1 A relationship based on empathy, emotional support and efforts to understand and relieve a person’s distress, suffering or concern. 2 effective interactions between participants, over time and across settings 3 staff, patients and families being active participants in decision making, 4 contextualized |
knowledge of the patient and family both individually and as members of a network of relationships. The relational processes and practices that support compassion require the development of skilled interpersonal relationships. “Knowing who I am and what matters to me”. “Understanding how I feel”. “Working together to shape the way things are done” are some of the keys to develop a relational practice.
3. Review on Measuring culturally competent compassion

3.1. Research question on the aspect of Measuring culturally competent compassion

How can compassion in nurses and other healthcare professionals be measured in multicultural clinical environments?

3.2. Search terms on the aspect of Measuring culturally competent compassion

Cultural competence results from development of four interesting domains:
- Cultural awareness (self-awareness, cultural identity, awareness of ethnocentrism and stereotyping).
- Cultural knowledge (anthropological, sociological, psychological and biological knowledge).
- Cultural sensitivity (empathy, communication, and relating skills).
- Cultural competence (assessment and clinical skills, and challenging and addressing discrimination in nursing and health care).

could create tensions in healthcare staff, in relation on how to best to achieve these aspirations:

- **Individual versus whole system:** The concern about using a reductionist approach is that people may plan quick fixes for each of the six values and not consider the entire system and context in which care takes place.

- **Courage versus fear:** Courage is about standing up for one’s innermost values and is essential to the delivery of compassionate, relationship-centred care.

- **Communication versus human relating:** There is a danger that attempts to improve communication lead to mechanistic models of training that focus on enactment of behavioural communication skills, such as listening and questioning aimed at goal directed communication and problem resolution.

- **Commitment to getting it right every time versus aspiring to be the best we can be:** The vision illustrates the core value of commitment as ‘to be looked

| Dewar, B., Nolan, M. | 2013 | United Kingdom | Registered Nurses, non-registered care staff, allied health care professionals and medical staff (n=35, i.e 85% of staff) | Agreeing a definition of compassionate relationship-centered care and identifying strategies to promote such care in acute hospital settings for older people. | Participant observation | Agreeing a definition of compassionate relationship-centered care and identifying strategies to promote such care in acute hospital settings for older people. | A model to implement compassionate relationship centered care for older people care setting, and comprising seven essential attributes in compassionate relationship-centered care: - Courageous - Connecting emotionally - Curious - Collaborating - Considering other perspectives - Compromising - Celebrating This 7 ‘C’s represent a far more complete, subtle and nuanced understanding of the day-to-day reality of delivering compassionate relationship-centred care than other extant models. |
Initiate the discussion of a set of universally applicable standards of practice for culturally competent care that nurses around the globe may use as guides in clinical practice, research, education, and administration.

In preparing these standards, nearly 50 relevant documents from nursing organizations around the world were examined, as well as related materials from other healthcare professions, governmental, NGO, and health and human service organizations.

Twelve Standards of practice for culturally competent nursing care:
- Social Justice
- Critical reflection
- Transcultural Nursing Knowledge
- Cross cultural practice
- Healthcare systems and organizations
- Patient advocacy and empowerment
- Multicultural workforce
- Education and training
- Cross cultural communication
- Cross cultural leadership
- Policy development
- Evidence-based practice and research

These standards may assist nurses to place cultural competence as a priority of care. Through the use of these 12 standards in practice, administration, education, and research, nurses may advocate for culturally competent care for the individual, family, community, and the populations they serve.
| Douglas, M. et al | 2014 | USA | Present universally applicable guidelines for implementing culturally competent care. | In preparing these guidelines, more than 50 documents from nursing organizations around the world were examined, as well as related materials from other health care professions, governmental, nongovernmental (NGO), and health and human service organizations. Once a draft of the guidelines was developed, a “Call for Comments” on the relevance, comprehensiveness, and feasibility of implementing these guidelines was published and distributed to solicit the opinions and criticisms from nurses worldwide. | Guidelines for the practice of Culturally Competent Nursing Care:  
- Knowledge of cultures  
- Education and training in culturally competent care  
- Critical reflection  
- Cross-cultural communication  
- Culturally Competent Care  
- Cultural competence in health care systems and organizations  
- Patient advocacy and empowerment  
- Multicultural workforces  
- Cross-cultural leadership  
- Evidence-based practice and research  
In conclusion, the authors believe that these guidelines should be adapted to the cultural context and setting in which they are used. The guidelines are not intended to be used as standards for minimal care, rather to provide some examples of how culturally competent care can be implemented. Authors recognize that there are variations in the interpretation of terms related to |
| Flowers, D. | 2004 | USA | Describe current population trends in North America, considering a recent trend that has influenced nursing considerably due to consumer mandate for culturally competent care in an increasingly diverse multicultural society. | Discuss the need for critical care nurses to develop cultural competence, present a model for development of cultural competence, and describe common pitfalls in the delivery of culturally competent care. |

It is presented a Model for cultural competence and their five component proposed by Campinha-Bacote and Munoz:

- **Cultural awareness**: Self-examination and in-depth exploration of one’s own cultural and professional background; identification of biases and possible prejudices when working with specific groups of clients.

- **Cultural knowledge**: The process of seeking and obtaining an information base on different cultural and ethnic groups, as well as understanding the groups’ world views, which will explain how members of a group interpret their illness and how being a member guides their thinking, doing, and being.

- **Cultural skill**: Ability to collect relevant cultural data about patients’ immediate problem and accurately perform culturally specific assessments; involves how to perform cultural assessments and culturally based

In order to facilitate the acquisition of cultural competence of preclinical newcomer population (ie, immigrant, refugee, and undocumented) in Massachusetts.

- Develop sensitivity, through first-hand experiences, to the difficulties people experience when living in a new country.
- Develop understanding of the culture and the health beliefs of a newcomer group and the problems they face in obtaining health care and other services in the United States.
- Promote a career preference to serve underserved and multicultural populations.

Also the curriculum for the Track integrates the following domestic and international learning experiences during the preclinical years:
- Family curriculum.
- Language immersion abroad.
- Domestic community service Project.
- Seminar series.
Willman, A.

Students

the outcome of a 3-year study program from a student perspective for the purpose of promoting culturally congruent nursing care

An instructive/didactic model for the promotion of culturally competent nursing care. The didactic model is based on Leininger’s Culture Care theory (Leininger, 1995, 2006). It emphasizes the importance of building the relationship between nurses and patients on a scientific knowledge base, with focus on achieving health and well-being.

At the beginning of the nursing program, students are introduced to the concepts of the Culture Care theory, The Sunrise Enabler (previously the Sunrise Model) as well as the Ethnonursing Method. When the students are in their second and 3-year clinical placements, they are given the opportunity to apply these concepts in the development of care plans for patients in community and hospital settings. Furthermore, the students use information from appropriate scientific articles to support the learning process.
In the first year an instructive and a questionnaire A are applied; then in the third year the questionnaire B is applied to see their progress.

| Kingdom | Cultural competence may be derived from previous research and appropriate literature, and discusses ways in which these components could make a contribution to developing cultural competence in healthcare undergraduates | Contribute to development of cultural competence in undergraduate healthcare curricula. This factors are:
- Awareness and acceptance of the wide range of cultural diversity (in developing systems of care).
- Acquisition of knowledge of cultural differences and similarities and knowledge of clients’ culture.
- Knowledge of one’s own cultural values and identity.
- Ability to communicate effectively across cultural groups.
- Use of knowledge to adapt services and skills.
Development of lifelong learning and reflection that includes examination of attitudes and values of cultural groups. |
|---------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|

59
5. Conclusion

Between 6 and 25 papers were identified within each review with least on the measurement of culturally competent compassion.

Briefly, the reviews generally showed that:
- Compassion universally appears to be a dimension of quality care, and having to do with actively responding to human suffering. It is thereby separated from terms such as pity and empathy although often applied synonymously with these.
- The concepts measured by the tools included empathy, recognizing and ending suffering, communication, patient involvement, competence and attending to patients' needs.
- Learning to deliver competent compassionate care must be patient-centered, focused in different aspects on cultural competence and adapted to different socio-cultural contexts. Programmes should combine active learning and theoretical content, as well as culture-generic and specific inputs. It is also desirable the involvement of patients, families and different kind of professionals in the planning and delivery of the training. So, to achieve and guarantee this training is effectively introduced within healthcare contexts staff requires appropriated support and strong leadership. An effective implementation of training requires a strong leadership. Results suggest a positive impact of different interventions but further research and deeper evaluation is needed.

Conclusively, this first IENE4 output demonstrates that very little literature on compassion is based on empirical research. The IENE 4 project will provide required insights on how nurses and other health professionals learn to practice culturally competent compassionate care.
